Summary

This closed-loop speed controller is designed with the latest type IGBT and MOS power devices. It takes advantage of DC brushless motor's Hall signal to double frequency for closed-loop speed control. PID control links with the speed controller. The control system is stable and reliable, especially at low speed, it always can reach the maximum torque, The speed control range is from 150 to 20000rpm.

1. Specification and Description

- PID speed, current double loop regulator
- 20KHZ chopper frequency
- Electrical stop to ensure the quick action
- Over load ratio larger than 2, the torque can always reach the maximum at low speed.
- Fault alarm function with Over voltage, Under voltage, Over current, Over temperature, and Hall signal illegal.

2. Product Characteristic

Drive model	DS-OLBS4-FRS4
Input voltage	24 VDC – 48 VDC
Under voltage protection	10VDC, Over voltage protection: 60VDC
Maximum continuous output current	10 A
Accelerate time constant, default	0.5 seconds, others can be customized

Warning

*** Do not measuring or touch any components without housing while operating.**
*** Should check soleplate or change fuse 1minter later after power off.**
*** Operating without housing is forbidden.**
*** Make sure to connect the ground terminal, otherwise, the brushless motor will working unsteadily.**
*** Sudden damage while drives working, our company only affords the service and replace in the guarantee. Personal injury and motor damage caused by the accident will invalidate the guarantee.**

3. Terminal Connection

3.1 Power Input

1	V+	24VDC~48VDC input
2	GND	GND input

3.2 Motor Input

1	MA	Motor A phase
2	MB	Motor B phase
3	MC	Motor C phase
4	GND	GND
5	HA	Hall signal A phase input
6	HB	Hall signal B phase input
7	HC	Hall signal C phase input
8	+5V	Hall signal power line

3.3 Control Signal

No.	Terminal Name	Description
1	GND	Signal ground
2	F/R	CW/CCW terminal
3	EN	Stop/Start terminal
4	BK	Brake terminal
5	SV	Analog signal input terminal
6	PG	Speed output terminal
7	ALM	Alarm output terminal
8	+5V	+5V power output terminal

Built-in potentiometer R-SI : Adjust the motor speed gain, which can be adjusted from 0~100%.

Built-in potentiometer R-CS : Maximum protection current setting, built-in potentiometer can be set 0%~100% continuous current protection.

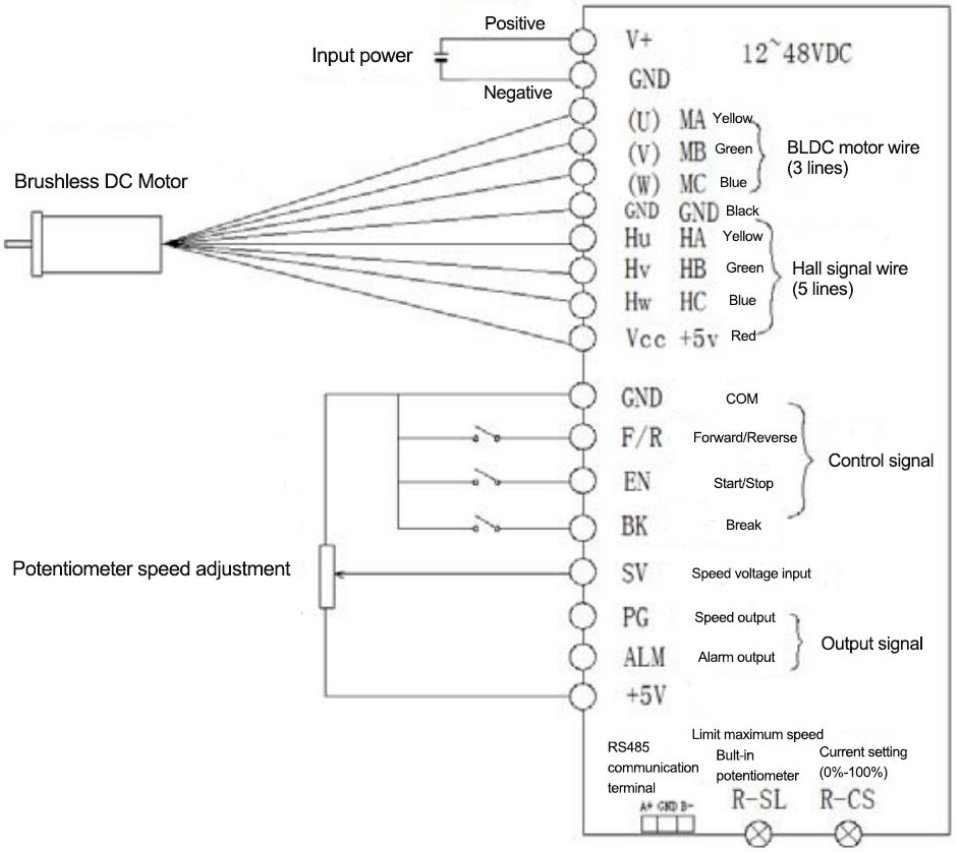
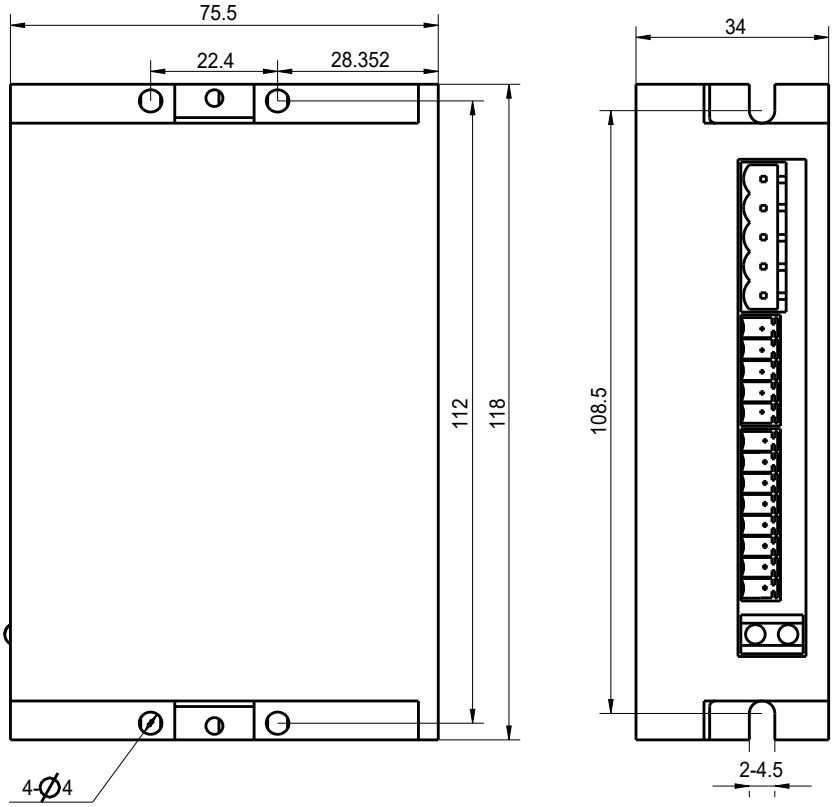
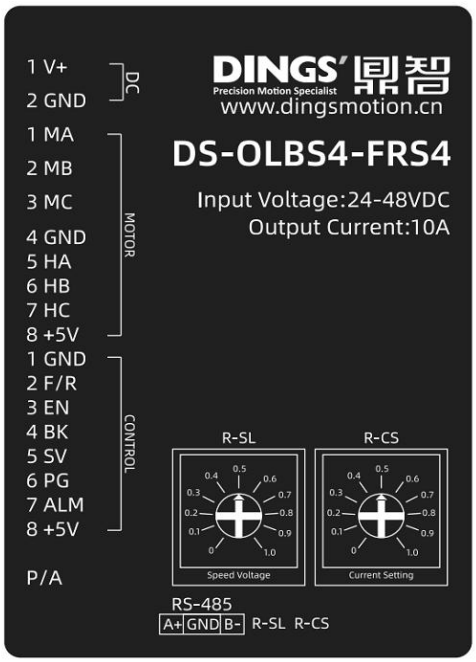
4. Connection Diagram of motor and driver



5. Dimension





6. Functions and Usage

6.1 Speed Adjustment Method

This driver provides the user below three-speed control method:

Inner potentiometer speed adjustment : Rotate the potentiometer on the driver panel counterclockwise, the rotate speed decrease, rotate the potentiometer on the driver panel clockwise, the rotate speed becomes higher. Please make sure the potentiometer is set in the minimum state when you use external input mode to adjust the speed.

External input adjustment : Connect the terminals of the external potentiometer to the GND and +6.25v terminal, connect the regulator terminal to SV, then you can adjust the speed by using an external potentiometer. It also can achieve speed adjust through other control units (Such as PLC, SCM, etc) input analog voltage to SV. The acceptance of SV is DC 0V~+5V, and the corresponding motor rotate speed is 0 to rated speed.

You also can use the external digital signal to adjust speed: apply PWM with 5V amplitude and 1KHz~2KHz Frequency between SV and GND to adjust the speed. the motor rotate speed is adjusted by the duty radio liner adjustment. At this time, by adjusting the R-SV potentiometer, SV digital signal amplitude can be 0~1.0 ratio attenuation processing. Generally, adjust R-SV to 1.0, SV input digital signal without attenuation processing.

6.2 Motor Operate / Stop Control (EN)

You can control the brushless motor to run or stop by controlling the terminal “EN” and “GND” connecting. The motor will be running when we connect the terminal “EN” to “GND”; when shut down, the motor will stop naturally, and the stopping time will be decided by the inertia and load adding on the motor.

6.3 Motor Rotation Direction Control (F/R)

You can control the motor rotation direction by controlling the terminal “F/R” and “GND” connection. When connect terminal “F/R” to terminal “GND”, the motor will run at CCW (view from motor output side), and when shut down, the motor will run at another direction.

Attention **If you need to change the motor rotation direction, please stop the motor at first, otherwise the driver shall be damaged.**

6.4 Brake the Motor to Stop (BK)

You can break the motor to stop if need. The motor will run when the terminal “BK” not connects to “GND”, but if you connect these two terminals, the motor will stop quickly. And the motor stopping time will be decided by inertia and load adding on the motor.

Attention **If you are not necessary to stop the motor quickly, please DO NOT use this function, cause it has some electrical and mechanical impact on the motor and driver.**

6.5 Speed Signal Output (PG)

The speed pulse output port is 0C, output 30V/10mA max. You can connect with a resistance (3K ohm ~10K ohm) between signal and input power to get the pulse signal, this port will output serial pulses which has fixed extent (it is 50uS). This output pulse from every rotation of the motor is 3 x N, “N” means the total pole number of the magnet. For example, 2 pair of poles, means 4 poles motor, 12 pulses per turn, when the motor speed is 500rpm, the pulses out from the PG is 6000.

6.6 Alarm Output (ALM)

The alarm output port is 0C, output 30V/10mA max. You can connect a resistance (3K ohm ~10K ohm) with the input power to get the alarm signal. When alarm, this port is connecting the GND (Low voltage), and the driver will stop working and keep in alarm status.

6.7 Drive Failure

Over-voltage or over-current will lead the driver to a protection status, the driver will automatically stop working, the motor stop and blue light are flashing. As long as you enable terminals to reset (EN and GND disconnected) or power Off, the driver will disarm the alarm. Please check the motor wiring once this failure occurred.

7. Communication Method

The communication mode adopts the standard Modbus protocol and conforms to the national standard GB/T 19582.1 - 2008. Using RS484 two-wire serial link communication, the physical interface uses the conventional 3-pin 2.54 wiring port (A, GND, B-) terminals, which is very convenient for serial connection. Transfer mode RTU, check mode CRC, CRC start word FFFFH. Data mode 8-bit asynchronous serial, 1 stop bit, invalid check bit,

support multiple communication rates (see parameter table for details).

Notes **If the communication mode control motor is required, it must be performed under the MBUS control mode and the internal control terminal.**

Function parameters support 03H multi-register read, 06H single register write.

8. Communication Wiring Method

RS-485 communication can be communicated by driving a conventional 3-pin 2.54 wiring port. The pins for a conventional 3-pin 2.54 wiring port are defined as follows:

Pin	Function
1	A
2	GND
3	B
